5-HT$_{2B}$ RECEPTOR ANTAGONISTS

This invention relates to 5-HT$_{2B}$ receptor antagonists, pharmaceutical compositions comprising such compounds, and the use of such compounds and compositions to treat various diseases.

Background to the invention

Serotonin, also referred to as 5-hydroxytryptamine (5-HT), is a neurotransmitter with mixed and complex pharmacological characteristics. 5-HT acts via a number of discrete 5-HT receptors. Currently, fourteen subtypes of serotonin receptor are recognised and delineated into seven families, 5-HT$_1$ to 5-HT$_7$. Within the 5-HT$_2$ family, 5-HT$_{2A}$, 5-HT$_{2B}$ and 5-HT$_{2C}$ subtypes are known to exist. The nomenclature and classification of 5-HT receptors has been reviewed by Martin and Humphrey, *Neuropharm.*, 33, 261-273 (1994) and Hoyer, *et al.*, *Pharm. Rev.*, 46, 157-203 (1994).

There is evidence to suggest a role for 5-HT$_{2B}$ receptors in a number of medical disorders, and therefore 5-HT$_{2B}$ receptor antagonists are likely to have a beneficial effect on patients suffering these disorders. They include, but are not limited to: disorders of the GI tract, and especially disorders involving altered motility, and particularly irritable bowel syndrome (WO 01/08668); disorders of gastric motility, dyspepsia, GERD, tachygastria; migraine/neurogenic pain (WO 97/44326); pain (US 5 958 934); anxiety (WO 97/44326); depression (WO 97/44326); benign prostatic hyperplasia (US 5 952 331); sleep disorder (WO 97/44326); panic disorder, obsessive compulsive disorder, alcoholism, hypertension, anorexia nervosa, and priapism (WO 97/44326); asthma and obstructive airway disease (US 5 952 331);

incontinence and bladder dysfunction (WO 96/24351);
disorders of the uterus, such as dysmenorrhoea, pre-term
labour, post-partum remodelling, endometriosis and fibrosis;
pulmonary hypertension (Launay, J.M., et al., *Nature
Medicine*, 8(10), 1129-1135 (2002)).

WO 97/44326 describes aryl pyrimidine derivatives and their
use as selective 5-HT$_{2B}$ antagonists. However, although this
application discloses a number of compounds, it is desirable
to find further classes of compounds to act as 5-HT$_{2B}$
antagonists, which are preferably selective against 5-HT$_{2A}$
and 5-HT$_{2C}$ receptors.

The present inventors have previously described such
compounds in co-pending applications PCT/GB2003/000567 and
PCT/GB2003/000552, filed 11 February 2003 and US 10/364,672,
filed 12 February 2003, which are all incorporated herein by
reference.

N_3: triazole (C_5), triazine (C_6); and,

N_4: tetrazole (C_5).

The bi-C_{5-7} aryl group includes the radical formed by removal of a hydrogen atom from any of the possible aromatic ring atoms of the 'first' aromatic ring, i.e. the ring from which the hydrogen atom is removed, and the 'second' aromatic ring, i.e. the ring from which the hydrogen atom is not removed, may be bonded to the first aromatic ring at any position in relation to the ring atom from which the hydrogen atom has been removed. For example, if both aromatic rings are unsubstituted benzene rings, then the following groups are possible:

biphen-2-yl   biphen-3-yl   biphen-4-yl
The phrase "optionally substituted", as used herein,
pertains to a parent group, as above, which may be
unsubstituted or which may be substituted by one of the

Includes Other Forms
Unless otherwise specified, included in the above are the
well known ionic, salt, solvate, and protected forms of
these substituents. For example, a reference to carboxylic
acid (-COOH) also includes the anionic (carboxylate) form
$(-COO^-)$, a salt or solvate thereof, as well as conventional

protected forms. Similarly, a reference to an amino group includes the protonated form ($-N^+HR^1R^2$), a salt or solvate of the amino group, for example, a hydrochloride salt, as well as conventional protected forms of an amino group. Similarly, a reference to a hydroxyl group also includes the anionic form ($-O^-$), a salt or solvate thereof, as well as conventional protected forms of a hydroxyl group.

Isomers, Salts, Solvates and Protected Forms
Certain compounds may exist in one or more particular geometric, optical, enantiomeric, diasteriomeric, epimeric, stereoisomeric, tautomeric, conformational, or anomeric forms, including but not limited to, cis- and trans-forms; E- and Z-forms; c-, t-, and r- forms; endo- and exo-forms; R-, S-, and meso-forms; D- and L-forms; d- and l-forms; (+) and (-) forms; keto-, enol-, and enolate-forms; syn- and anti-forms; synclinal- and anticlinal-forms; α- and β-forms; axial and equatorial forms; boat-, chair-, twist-, envelope-, and halfchair-forms; and combinations thereof, hereinafter collectively referred to as "isomers" (or "isomeric forms").

Note that, except as discussed below for tautomeric forms, specifically excluded from the term "isomers," as used herein, are structural (or constitutional) isomers (i.e., isomers which differ in the connections between atoms rather than merely by the position of atoms in space). For example, a reference to a methoxy group, $-OCH_3$, is not to be construed as a reference to its structural isomer, a hydroxymethyl group, $-CH_2OH$. Similarly, a reference to ortho-chlorophenyl is not to be construed as a reference to its structural isomer, meta-chlorophenyl. However, a reference to a class of structures may well include

structurally isomeric forms falling within that class
(e.g., C_{1-7}alkyl includes n-propyl and iso-propyl; butyl
includes n-, iso-, sec-, and tert-butyl; methoxyphenyl
includes ortho-, meta-, and para-methoxyphenyl).

The above exclusion does not pertain to tautomeric forms,
for example, keto-, enol-, and enolate-forms, as in, for
example, the following tautomeric pairs: keto/enol
(illustrated below), imine/enamine, amide/imino alcohol,
amidine/amidine, nitroso/oxime, thioketone/enethiol,
N-nitroso/hyroxyazo, and nitro/aci-nitro.

$$\underset{\text{keto}}{\overset{H}{\underset{|}{\overset{|}{-C}}} - C\overset{O}{\diagdown}} \rightleftharpoons \underset{\text{enol}}{\diagup C = C \overset{OH}{\diagdown}} \quad \overset{H^+}{\underset{H^+}{\rightleftharpoons}} \quad \underset{\text{enolate}}{\diagup C = C \overset{O^-}{\diagdown}}$$
Tautomeric forms of particular relevance to the present
invention include those of formula II, as illustrated below:
Note that specifically included in the term "isomer" are
compounds with one or more isotopic substitutions. For
example, H may be in any isotopic form, including ^1H, ^2H
(D), and ^3H (T); C may be in any isotopic form, including
^{12}C, ^{13}C, and ^{14}C; O may be in any isotopic form, including
^{16}O and ^{18}O; and the like.

Unless otherwise specified, a reference to a particular
compound includes all such isomeric forms, including (wholly

or partially) racemic and other mixtures thereof. Methods
for the preparation (e.g., asymmetric synthesis) and
separation (e.g., fractional crystallisation and
chromatographic means) of such isomeric forms are either
known in the art or are readily obtained by adapting the
methods taught herein, or known methods, in a known manner.

Unless otherwise specified, a reference to a particular
compound also includes ionic, salt, solvate, and protected
forms of thereof, for example, as discussed below.

It may be convenient or desirable to prepare, purify, and/or
handle a corresponding salt of the active compound, for
example, a pharmaceutically-acceptable salt. Examples of
pharmaceutically acceptable salts are discussed in Berge et
al., 1977, "Pharmaceutically Acceptable Salts," J. Pharm.
Sci., Vol. 66, pp. 1-19.

For example, if the compound is anionic, or has a functional
group which may be anionic (e.g., -COOH may be -COO$^-$), then
a salt may be formed with a suitable cation. Examples of
suitable inorganic cations include, but are not limited to,
alkali metal ions such as Na$^+$ and K$^+$, alkaline earth cations
such as Ca^{2+} and Mg^{2+}, and other cations such as Al^{3+}.
Examples of suitable organic cations include, but are not
limited to, ammonium ion (i.e., NH$_4$$^+$) and substituted
ammonium ions (e.g., NH$_3$R$^+$, NH$_2$R$_2$$^+$, NHR$_3$$^+$, NR$_4$$^+$). Examples of
some suitable substituted ammonium ions are those derived
from: ethylamine, diethylamine, dicyclohexylamine,
triethylamine, butylamine, ethylenediamine, ethanolamine,
diethanolamine, piperazine, benzylamine, phenylbenzylamine,
choline, meglumine, and tromethamine, as well as amino

acids, such as lysine and arginine. An example of a common
quaternary ammonium ion is $N(CH_3)_4^+$.

If the compound is cationic, or has a functional group which
may be cationic (e.g., $-NH_2$ may be $-NH_3^+$), then a salt may be
formed with a suitable anion. Examples of suitable
inorganic anions include, but are not limited to, those
derived from the following inorganic acids: hydrochloric,
hydrobromic, hydroiodic, sulfuric, sulfurous, nitric,
nitrous, phosphoric, and phosphorous.

Examples of suitable organic anions include, but are not
limited to, those derived from the following organic acids:
2-acetyoxybenzoic, acetic, ascorbic, aspartic, benzoic,
camphorsulfonic, cinnamic, citric, edetic, ethanedisulfonic,
ethanesulfonic, fumaric, glucoheptonic, gluconic, glutamic,
glycolic, hydroxymaleic, hydroxynaphthalene carboxylic,

pantothenic, phenylacetic, phenylsulfonic, propionic,
pyruvic, salicylic, stearic, succinic, sulfanilic, tartaric,
toluenesulfonic, and valeric. Examples of suitable
polymeric organic anions include, but are not limited to,
those derived from the following polymeric acids: tannic
acid, carboxymethyl cellulose.

It may be convenient or desirable to prepare, purify, and/or
handle a corresponding solvate of the active compound. The
term "solvate" is used herein in the conventional sense to
refer to a complex of solute (e.g., active compound, salt of
active compound) and solvent. If the solvent is water, the
solvate may be conveniently referred to as a hydrate, for
example, a mono-hydrate, a di-hydrate, a tri-hydrate, etc.

It may be convenient or desirable to prepare, purify, and/or
handle the active compound in a chemically protected form.
The term "chemically protected form" is used herein in the
conventional chemical sense and pertains to a compound in
which one or more reactive functional groups are protected
from undesirable chemical reactions under specified
conditions (e.g., pH, temperature, radiation, solvent, and
the like). In practice, well known chemical methods are
employed to reversibly render unreactive a functional group,
which otherwise would be reactive, under specified
conditions. In a chemically protected form, one or more
reactive functional groups are in the form of a protected or
protecting group (also known as a masked or masking group or
a blocked or blocking group). By protecting a reactive
functional group, reactions involving other unprotected
reactive functional groups can be performed, without
affecting the protected group; the protecting group may be
removed, usually in a subsequent step, without substantially
affecting the remainder of the molecule. See, for example,
Protective Groups in Organic Synthesis (T. Green and
P. Wuts; 3rd Edition; John Wiley and Sons, 1999).

A wide variety of such "protecting", "blocking", or
"masking" methods are widely used and well known in organic
synthesis. For example, a compound which has two
nonequivalent reactive functional groups, both of which
would be reactive under specified conditions, may be
derivatized to render one of the functional groups
"protected," and therefore unreactive, under the specified
conditions; so protected, the compound may be used as a
reactant which has effectively only one reactive functional
group. After the desired reaction (involving the other

functional group) is complete, the protected group may be
"deprotected" to return it to its original functionality.

For example, a hydroxy group may be protected as an ether
(-OR) or an ester (-OC(=O)R), for example, as: a t-butyl
ether; a benzyl, benzhydryl (diphenylmethyl), or trityl
(triphenylmethyl) ether; a trimethylsilyl or
t-butyldimethylsilyl ether; or an acetyl ester (-OC(=O)CH$_3$,
-OAc).

For example, an aldehyde or ketone group may be protected as
an acetal (R-CH(OR)$_2$) or ketal (R$_2$C(OR)$_2$), respectively, in
which the carbonyl group (>C=O) is converted to a diether
(>C(OR)$_2$), by reaction with, for example, a primary alcohol.
The aldehyde or ketone group is readily regenerated by
hydrolysis using a large excess of water in the presence of
acid.

For example, an amine group may be protected, for example,
as an amide (-NRCO-R) or a urethane (-NRCO-OR), for example,
as: a methyl amide (-NHCO-CH$_3$); a benzyloxy amide (-NHCO-
OCH$_2$C$_6$H$_5$, -NH-Cbz); as a t-butoxy amide (-NHCO-OC(CH$_3$)$_3$,
-NH-Boc); a 2-biphenyl-2-propoxy amide (-NHCO-
OC(CH$_3$)$_2$C$_6$H$_4$C$_6$H$_5$, -NH-Bpoc), as a 9-fluorenylmethoxy amide
(-NH-Fmoc), as a 6-nitroveratryloxy amide (-NH-Nvoc), as a
2-trimethylsilylethyloxy amide (-NH-Teoc), as a 2,2,2-
trichloroethyloxy amide (-NH-Troc), as an allyloxy amide
(-NH-Alloc), as a 2(-phenylsulfonyl)ethyloxy amide
(-NH-Psec); or, in suitable cases (e.g., cyclic amines), as
a nitroxide radical (>N-O·).

For example, a carboxylic acid group may be protected as an
ester for example, as: an C$_{1-7}$alkyl ester (e.g., a methyl

ester; a t-butyl ester); a C_{1-7}haloalkyl ester (e.g., a
C_{1-7}trihaloalkyl ester); a triC_{1-7}alkylsilyl-C_{1-7}alkyl ester;
or a C_{5-20}aryl-C_{1-7}alkyl ester (e.g., a benzyl ester; a
nitrobenzyl ester); or as an amide, for example, as a methyl
amide.

For example, a thiol group may be protected as a thioether
(-SR), for example, as: a benzyl thioether; an
acetamidomethyl ether (-S-CH_2NHC(=O)CH_3).

The term "treatment," as used herein in the context of
treating a condition, pertains generally to treatment and
therapy, whether of a human or an animal (e.g., in
veterinary applications), in which some desired therapeutic
effect is achieved, for example, the inhibition of the
progress of the condition, and includes a reduction in the
rate of progress, a halt in the rate of progress,
amelioration of the condition, and cure of the condition.
Treatment as a prophylactic measure (i.e., prophylaxis) is
also included.

The term "therapeutically-effective amount," as used herein,
pertains to that amount of an active compound, or a
material, composition or dosage from comprising an active
compound, which is effective for producing some desired
therapeutic effect, commensurate with a reasonable
benefit/risk ratio, when administered in accordance with a
desired treatment regimen. Suitable dose ranges will
typically be in the range of from 0.01 to 20 mg/kg/day,
preferably from 0.1 to 10 mg/kg/day.

Compositions and their administration
Compositions may be formulated for any suitable route and

means of administration. Pharmaceutically acceptable
carriers or diluents include those used in formulations
suitable for oral, rectal, nasal, topical (including buccal
and sublingual), vaginal or parenteral (including
subcutaneous, intramuscular, intravenous, intradermal,
intrathecal and epidural) administration. The formulations
may conveniently be presented in unit dosage form and may be
prepared by any of the methods well known in the art of
pharmacy. Such methods include the step of bringing into
association the active ingredient with the carrier which
constitutes one or more accessory ingredients. In general
the formulations are prepared by uniformly and intimately
bringing into association the active ingredient with liquid
carriers or finely divided solid carriers or both, and then,
if necessary, shaping the product.

For solid compositions, conventional non-toxic solid
carriers include, for example, pharmaceutical grades of
mannitol, lactose, cellulose, cellulose derivatives, starch,
magnesium stearate, sodium saccharin, talcum, glucose,
sucrose, magnesium carbonate, and the like may be used. The
active compound as defined above may be formulated as
suppositories using, for example, polyalkylene glycols,
acetylated triglycerides and the like, as the carrier.
Liquid pharmaceutically administrable compositions can, for
example, be prepared by dissolving, dispersing, etc, an
active compound as defined above and optional pharmaceutical
adjuvants in a carrier, such as, for example, water, saline
aqueous dextrose, glycerol, ethanol, and the like, to
thereby form a solution or suspension. If desired, the
pharmaceutical composition to be administered may also
contain minor amounts of non-toxic auxiliary substances such
as wetting or emulsifying agents, pH buffering agents and

the like, for example, sodium acetate, sorbitan monolaurate,
triethanolamine sodium acetate, sorbitan monolaurate,
triethanolamine oleate, etc. Actual methods of preparing
such dosage forms are known, or will be apparent, to those
skilled in this art; for example, see Remington's
Pharmaceutical Sciences, Mack Publishing Company, Easton,
Pennsylvania, 15th Edition, 1975. The composition or
formulation to be administered will, in any event, contain a
quantity of the active compound(s) in an amount effective to
alleviate the symptoms of the subject being treated.

Dosage forms or compositions containing active ingredient in
the range of 0.25 to 95% with the balance made up from non-
toxic carrier may be prepared.

For oral administration, a pharmaceutically acceptable non-
toxic composition is formed by the incorporation of any of
the normally employed excipients, such as, for example,
pharmaceutical grades of mannitol, lactose, cellulose,
cellulose derivatives, sodium crosscarmellose, starch,
magnesium stearate, sodium saccharin, talcum, glucose,
sucrose, magnesium carbonate, and the like. Such
compositions take the form of solutions, suspensions,
tablets, pills, capsules, powders, sustained release
formulations and the like. Such compositions may contain
1%-95% active ingredient, more preferably 2-50%, most
preferably 5-8%.

Parenteral administration is generally characterized by
injection, either subcutaneously, intramuscularly or
intravenously. Injectables can be prepared in conventional
forms, either as liquid solutions or suspensions, solid
forms suitable for solution or suspension in liquid prior to

injection, or as emulsions. Suitable excipients are, for example, water, saline, dextrose, glycerol, ethanol or the like. In addition, if desired, the pharmaceutical compositions to be administered may also contain minor amounts of non-toxic auxiliary substances such as wetting or emulsifying agents, pH buffering agents and the like, such as for example, sodium acetate, sorbitan monolaurate, triethanolamine oleate, triethanolamine sodium acetate, etc.

The percentage of active compound contained in such parental compositions is highly dependent on the specific nature thereof, as well as the activity of the compound and the needs of the subject. However, percentages of active ingredient of 0.1% to 10% in solution are employable, and will be higher if the composition is a solid which will be subsequently diluted to the above percentages. Preferably, the composition will comprise 0.2-2% of the active agent in solution.

General Synthesis Methods

Compounds of formula I can be synthesised by the following
route:
Route 1

wherein R^2, R^3, R^{N1} and R^{N2} are as defined above, and Ar^1 is
either R^1, as defined above (i.e. an optionally substituted
C_{9-14} aryl group or an optionally substituted C_{5-7} aryl group,
which includes an optionally substituted bi-C_{5-7} aryl group)
or the first aromatic ring of the bi-C_{5-7} aryl group with a
moiety for attaching the second aromatic ring of the bi-C_{5-7}
aryl group. In the latter case, the method of route 1 is
followed by a further step of joining the second aromatic
ring of the bi-C_{5-7} aryl group to the first aromatic ring.

The method of route 1 is carried out in solution (for
example, aqueous) optionally in the presence of base with
heating (for example, microwave heating).

If Ar^1 is only the first aromatic ring of the bi-C_{5-7} aryl
group, then it preferably bears either:
(i) a halogen, such as bromo, iodo or chloro, or a group
which is subsequently converted into a triflic group, for
example a protected alcohol; or

(ii) a group, such as bromo or iodo, which is subsequently
converted into, for example, a boronic acid group or
derivative thereof, or certain magnesium, tin or zinc
containing organometallic reagents.

The second aromatic ring of the bi-C_{5-7} aryl group bears the
other of the final groups of (i) and (ii) above, such that
the two rings may be joined by a palladium catalysed
coupling reaction. The palladium catalyst may be
tetrakis(triphenylphosphine)palladium(0), and the reaction
may be carried out in the presence of an inorganic base,
such as sodium carbonate. The reaction is usually carried
out by heating at about 80-90°C for several hours.

Compounds of formula II, where R^{N5} and R^{N6} are H, can be
synthesised by the following route:
Route 2

wherein R^5 is as defined above, and Ar^2 is either R^4, as
defined above (i.e. an optionally substituted C_{9-14} aryl
group or an optionally substituted bi-C_{5-7} aryl group) or the
first aromatic ring of the bi-C_{5-7} aryl group with a moiety
for attaching the second aromatic ring of the bi-C_{5-7} aryl
group. In the latter case, the method of route 2 includes
a further step of joining the second aromatic ring of the
bi-C_{5-7} aryl group to the first aromatic ring. This further
step may occur between steps (i) and (ii), or after step
(ii).

- 43 -

Step (i) is usually carried out by heating the two reactants
in organic solvent (for example, DMF). The second step,
which is the removal of the acetyl group is carried out
under standard conditions, for example, in a 5:1 mixture of
industrial methylated spirits and water in the presence of
concentrated sulfuric acid, followed by basification.

If Ar^2 is only the first aromatic ring of the bi-C_{5-7} aryl
group, then its preferred substituents and method of joing
the second aromatic ring are as above for Ar^1.

Compounds of formula IIIa and IIIb where at least one of R^{N9}
and R^{N10} is hydrogen can be synthesised following the route
disclosed by Cockerill (Cockerill, A.F., et al., *Synthesis*,
1976, 591-593 which is incorporated herein by reference).
Route 3

where R^8 and R^{N9} are as defined), and Ar^3 is either R^7, as
defined above (i.e. an optionally substituted bi-C_{5-7} aryl
group) or the first aromatic ring of the bi-C_{5-7} aryl group
with a moiety for attaching the second aromatic ring of the
bi-C_{5-7} aryl group. In the latter case, the method of route
3 includes a further step of joining the second aromatic
ring of the bi-C_{5-7} aryl group to the first aromatic ring.

In this method the 2-amino oxazole is produced by the
condensation of the appropriate α-hydroxy ketone with
cyanamide or alkylcyanamide, which reaction can be carried
out in aqueous solution or in the presence of a mineral acid
or a base catalyst (e.g. sodium hydroxide).

The inventors have found that product of the reaction may be
either the 2-amino-4-aryl oxazole, the 2-amino-5-aryl
oxazole, or a mixture of the two, with the 2-amino-5-aryl
oxazole being favoured. It is thought that carrying the
reaction out under milder conditions may increase the amount
of the 2-amino-4-aryl oxazole produced.

If the product of the method is a mixture of compounds of
formula IIIa and IIIb these may be separated by column
chromatography.

Without wishing to be bound by theory, the product of formula
IIIb results from the reaction of the tautomeric form of the
starting material:

$$HO \underset{Ar^3}{\overset{\overset{\displaystyle O}{\|}}{\diagdown}} R^8$$
The two tautometric forms of the starting material exist in
equilibrium, which under the conditions of the reaction
tends to favour the formation of IIIb rather than IIIa.

The starting α-hydroxyketones can be synthesised via α-bromo
and α-acetoxy intermediates, some of which are commercially
available, from the parent ketones.

The substitution on the 2-amino group can be introduced
using a substituent on the cyanamide, or may be introduced

later in the reaction scheme, again with, if necessary, protection of other functional groups in the molecule.

The compounds of formula IIIb when R^{N9} and R^{N10} represent hydrogen may also be obtained regio-specifically be reacting an α-bromoketone with cyanamide in ethanol in the presence of sodium ethoxide and proceeds via a cyano α-aminoketone, as shown in Route 4:
Route 4

Compounds of formula IIIb where R^8 is hydrogen and R^{N9} and R^{N10} are hydrogen or an alkyl group may also be preared by a stereoselective method described by van Leusen, *et al.*, *J. Org. Chem.*, **46**, 2069-2072(1981), which is incorporated herein by reference, that employs the reaction of an N-tosylmethylcarbodiimide with an aromatic aldehyde in a solvent, such as methylene chloride, in the presence of a base (e.g. aqueous sodium hydroxide) and a phase transfer catalyst (e.g. tetrabutylammonium bromide), as shown in Route 5. For compounds where R^{N9} is hydrogen, the group R^{N9} in the carbodiimide is a trityl group that is removed after condensing with the aldehyde by treatment with mineral acid.

$$TosCH_2N{=}C{=}NR^{N9} \quad + \quad Ar^3CHO \longrightarrow$$
Route 5

Compounds of formula IIIa can be prepared by following the route (Route 6) described by Gompper, R., and Christmann, O., *Chem. Ber.* **92**, 1944 -1949 (1959), which is incorporated herein by reference, in which the 2-amino or 2-alkylamino oxazole is produced by condensing the appropriate α-bromo ketone with urea or substituted urea, which reaction is carried out in an organic solvent, e.g. dimethylformamide.
Route 6

The 5-substituent on the oxazole ring is present in the starting material as the alkyl chain of the α-bromo alkylarylketone, which can be obtained from the parent alkylarylketone if necessary.

This route can be used for compounds of formula IIIa where R^7 is an optionally substituted C_{9-14} aryl group and R^{N9} and R^{N10} are hydrogen or alkyl groups but is less preferred for these compounds.

The starting ketones for both routes are either commercially available or accessible by, for example, Grignard reactions on the corresponding nitriles or Friedal Crafts reaction of substituted aryls.

A further method of preparing compounds of formula IIIa and IIIb respectively is by a palladium catalysed coupling reaction of a 2-amino-4-substituted oxazole or 2-amino-5-substituted oxazole with an aryl boronic acid, or derivative thereof. The 4- or 5-substituent on the oxazole ring may

typically be a halogen, such as bromo, iodo or chloro, or a
group such as trifluoromethanesulfonate or a phophate ester.
The aryl boronic acid may also be replaced by certain
magnesium, tin or zinc containing organometallic reagents.
For example, a 2-amino-4-bromo-oxazole may be reacted with
an aryl boronic acid derivative in an aqueous solvent, for
example a mixture of ethanol, water and dimethoxyethane,
containing a palladium catalyst such as
tetrakis(triphenylphosphine)palladium(0) and an inorganic
base such as sodium carbonate. The reaction is carried out
by heating at about 80-90°C for several hours.

$$Ar^3B(OH)_2 \ + \quad [\text{oxazole structure with } R^{N9}, R^{N10}-N, O, N, R^8, Br] \quad \longrightarrow \quad [\text{oxazole structure with } R^{N9}, R^{N10}-N, O, N, R^8, Ar^3] \qquad \text{(IIIa)}$$

$$Ar^3B(OH)_2 \ + \quad [\text{oxazole structure with } R^{N9}, R^{N10}-N, N, O, R^8, Br] \quad \longrightarrow \quad [\text{oxazole structure with } R^{N9}, R^{N10}-N, N, O, R^8, Ar^3] \qquad \text{(IIIb)}$$
Route 7

Alternatively, the boronic acid residue, or equivalent, may
be on the 4-position of the oxazole ring and the halogen, or
equivalent, on the aryl group.

If Ar^3 in the above route represents only the first aromatic
ring of the bi-C_{5-7} aryl group, then appropriate protection,
or the use of precursor groups, may be required to prevent
unwanted side reactions.

- 48 -

Compounds of formulae IIIa and IIIb may also be prepared by
nucleophilic displacement of the intermediate chloro
compounds with ammonia or amines as described, for example,
by Marchetti, E., *et al.*, *J. Med. Chem.*, **11**, 1092-1093
(1968), which are incorporated herein by reference.

Compounds of formulae IVa and IVb, where R^{N13} and R^{N14} are
both hydrogen, may be synthesised by the following route
following that described in Reiter, J. and Pongo, L., *J.
Het. Chem.*, **23**, 401-408 (1986), which is incorporated herein
by reference:

(IVa)   (IVb)
Route 8

where Ar^4 is either R^7, as defined above (i.e. an optionally
substituted C_{9-14} aryl group or an optionally substituted bi-
C_{5-7} aryl group) or the first aromatic ring of the bi-C_{5-7}
aryl group with a moiety for attaching the second aromatic
ring of the bi-C_{5-7} aryl group. In the latter case, the
method of route 2 includes a further step of joining the
second aromatic ring of the bi-C_{5-7} aryl group to the first
aromatic ring.

If the reaction does result in a mixture of a compound of
formula IVa and a compound of formula IVb, then these may be
separated using, for example, column chromatography.

In any of the above routes, any substitution on the C_{9-14} aryl group or bi-C_{5-7} aryl group is preferably present in the relevant starting material, but could be introduced later in the reaction scheme, with, if necessary, appropriate protection of other functional groups present in the molecule. Derivation of the amino group attached to the central ring of the compound is possible to provide varied groups at that position.

The following preferences may be combined with one another, and may be different for each aspect of the present invention.

The optional substituents for all groups are preferably independently selected from halo, hydroxy, alkoxy (more preferably C_{1-4} alkoxy), amino (more preferably NH_2, C_{1-4} alkyl amino, C_{1-4} dialkyl amino), and amido (more preferably $CONH_2$, C_{1-4} alkyl amido, C_{1-4} dialkyl amido)

If R^1 is an optionally substituted bi-C_{5-7} aryl group, then it is preferably a bi-C_6 aryl group and is more preferably a bi-phenyl group. Most preferably R^1 is a 3-phenyl-phenyl group. It is preferred that any subtituent is on the distal phenyl ring, preferably at the 2-position.

If R^1 is an optionally substituted C_{9-14} aryl group, preferred substituent groups for the C_{9-14} aryl group (especially when X is O) include halo, hydroxy, C_{1-4} alkoxy, cyano, amino, amido and C_{1-4} alkyl, of which hydroxy, and C_{1-4} alkoxy are more preferred. It is also preferred that the C_{9-14} aryl group bears no oxo substituents.

If the C_{9-14} aryl group is a naphth-1-yl group, preferred substituent positions are 2, 4 and 7, with 2 being most preferred. The preferred substituents at the 2-position are hydroxy, C_{1-4} alkyl and C_{1-4} alkoxy, with C_{1-4} alkoxy (e.g. methoxy and ethoxy) being most preferred.

Imidazoles
R^{N5} *and* R^{N6}
In some embodiments it is preferred that both R^{N5} and R^{N6} are

substituted, and in other embodiments that only one or
neither of R^{N5} and R^{N6} are substituted. Each of R^{N5} and R^{N6}
are preferably independently selected from H, R, R' and
C(=O)R, where R and R' are as defined above, and more
preferably selected from H, R and C(=O)R. R is preferably
an optionally substituted C_{1-4} alkyl group. The preferred
substituents for R and R' include halo, hydroxy, amino and
acetyl. More preferably, at least one of R^{N5} and R^{N6} is H,
and the other is selected from H and C(=O)Me. There is a
preference for at least one of R^{N5} and R^{N6} to be R, R', SO_2R,
C(=O)R, $(CH_2)_nNR^{N7}R^{N8}$, when R^4 is an unsubstituted 4-phenyl-
phenyl group.

R^5

R^5 is preferably selected from H, optionally substituted C_{1-6}
alkyl and optionally substituted C_{3-7} cycloalkyl, more
preferably from H and unsubstituted C_{1-6} alkyl (preferably
methyl, and -C(CH_3)_2) and is most preferably H. There is a
preference for R^5 to be an optionally substituted C_{1-6} alkyl,
C_{3-7} cycloalkyl, C_{3-7} cycloalkyl, C_{3-7} cycloalkyl-C_{1-4} alkyl and
phenyl-C_{1-4} alkyl, with a further preference for C_{1-6} alkyl,
especially C_{1-3} alkyl (e.g. methyl, iso-propyl), when R^4 is
an unsubstituted naphthyl group.

R^4

R^4 is preferably an optionally substituted C_{9-14} aryl group

(for example, 3-phenyl-phenyl and 4-phenyl-phenyl).

R^4 is preferably optionally substituted C_{9-14} carboaryl
group, for example, naphth-1-yl, naphth-2-yl, anthracen-1-
yl, anthracen-2-yl, anthracen-9-yl, phenanthren-1-yl,

are preferably independently selected from H, R, R', where R
and R' are as defined above, and more preferably selected
from H and R.   R is preferably an optionally substituted C_{1-4}
alkyl group.   The preferred substituents for R and R'

The phenyl groups are preferably either unsubstituted or substituted with an alkoxy (preferably methoxy), halo (preferably chloro), C_{1-4} alkyl (preferably methyl or iso-propyl) or hydroxy. It is preferred that the subtituent is on the distal phenyl ring, preferably at the 2-position.

The selectivity of the compound for antagonising 5-HT_{2B} receptors over 5-HT_{2A} and/or 5-HT_{2C} receptors can be quantified by dividing the Ki for 5-HT_{2B} (see below) by the Ki for 5-$HT_{2A/2C}$ (see below). The resulting ratio is preferably 10 or more, more preferably 100 or more.

The following examples illustrate the invention.

Human cloned 5-HT$_{2B}$ receptor binding assay
The binding affinity of the compounds for human cloned 5-
HT$_{2B}$ receptors was determined using the following assay.

CHO-K1 cells expressing cloned 5-HT$_{2B}$ receptor were
maintained in Ultra-CHO medium containing 400µg/ml of G418,
100U/ml penicillin, 100µg/ml streptomycin, 2.5µg/ml
fungizone and 1% foetal bovine serum, in 95/5% O$_2$/CO$_2$ at
37°C. The cells were harvested using 0.25% trypsin and were
centrifuged at 800rpm for 8 minutes. The cells were
homogenised in 50mM HEPES buffer containing 1mM disodium
EDTA and 1mM PMSF at pH 7.4, using a Dounce homogeniser (20
strokes). The homogenate was centrifuged at 2280rpm (1000g)
and 4°C for 10 minutes, after which the supernatant was
removed by decanting. The pellet was re-homogenised as
above, and the resulting supernatant removed and combined
with that already obtained. The supernatant solution was
then centrifuged at 18300rpm (40000g) for 10 minutes at 4°C
using a Sorvall centrifuge. The supernatant was removed, and
the pellet was re-suspended in 50mM buffer at pH 7.4 using a
Ultra-turrax T25 Polytron, before centrifugation again at

- 142 -

40000g as above. This wash procedure was repeated, after
which the membrane preparation was stored at a concentration
of 1mg/ml at -80°C until use.

The membranes were thawed rapidly and diluted in assay
buffer containing Tris-HCl (50mM, pH 7.4), ascorbic acid
(0.1%) and calcium chloride (4mM). The membranes were
homogenised to resuspend them, prior to adding 10 or 15µg of
membranes to assay wells containing [^{3}H]LSD (1nM), assay
buffer (50mM Tris, 4mM calcium chloride and 0.1% ascorbic
acid) containing pargyline (10µM), and the test compounds
(1x10^{-10} to 1x10^{-4}M). Non specific binding was determined in
the presence of 100µM 5-HT. After 30 minutes incubation at
37°C, the assay mixture was filtered through a combination
of GF-C and GF-B filters, pre-soaked in 1%
polyethyleneimine, using a Brandel cell harvester, and were
washed three times using 50mM Tris-HCl. Radioactivity
retained on the filters was determined by liquid
scintillation counting. For each test compound, the
concentration that inhibited binding of [^{3}H]LSD by 50% was
determined using curve fitting software (Prism). Kd values
(concentration of LSD required to occupy 50% of the receptor
binding sites at equilibrium) determined from saturation
binding studies were then used to calculate inhibition
dissociation constants (Ki) using the following equation:

$$Ki = \frac{IC_{50}}{1 + \left(\dfrac{Radioligand\ concentration}{Radioligand\ Kd} \right)}$$

The results are shown in table 1 below as pKi values. This

Human 5-HT$_{2A}$ and 5-HT$_{2C}$ receptor binding assays
The binding affinity of ligands for human 5-HT$_{2A}$ and 5-HT$_{2C}$
receptors was determined using the following assay. These
results were then used to determine the selectivity of the
test compounds for 5-HT$_{2B}$ receptors, over 5-HT$_{2A}$ and 5-HT$_{2C}$
receptors.

Membrane preparations from CHO-K1 cells expressing the
cloned human 5-HT$_{2A}$ receptor were obtained (Euroscreen). The
membranes were thawed rapidly and diluted in assay buffer
containing Tris-HCl (50mM, pH 7.7). The membranes were
resuspended by homogenisation, prior to adding 15µg of
membranes to assay wells containing [3H] ketanserin (1nM),
assay buffer (50mM Tris at pH 7.4) containing pargyline
(10µM), and test compounds (1x10^{-10} to 1x10^{-4}M). Non specific
binding was determined in the presence of 100µM mianserin.
After 15 minutes incubation at 37°C, the assay mixture was
filtered through a combination of GF-C and GF-B filters,
pre-soaked in 0.05% Brij, using a Brandel cell harvester,
and were washed three times using ice cold Tris-HCl buffer
(50mM). Radioactivity retained on the filters was determined
by liquid scintillation counting. For each test compound,
the concentration that inhibited binding of [3H]ketanserin
by 50% was determined using curve fitting software (Prism).
Kd values (concentration of ketanserin required to occupy
50% of the receptor binding sites at equilibrium)determined
from saturation binding studies were then used to calculate
inhibition dissociation constants (Ki) using the following
equation:

$$Ki = \frac{IC_{50}}{1 + \left(\dfrac{Radioligand\ concentration}{Radioligand\ Kd}\right)}$$

Membrane preparations from CHO-K1 cells expressing the
cloned human 5-HT$_{2C}$ receptor were obtained (Euroscreen). The
membranes were thawed rapidly and diluted in assay buffer
containing Tris-HCl (50mM, pH 7.7), ascorbic acid (0.1%) and
pargyline (10µM). The membranes were resuspended by
homogenisation, prior to adding 6µg of membranes to assay
wells containing [^{3}H] mesulergine (1nM), assay buffer (50mM
Tris at pH 7.7 and 0.1% ascorbic acid) containing pargyline
(10µM), and test compounds (1x10^{-10} to 1x10^{-4}M). Non specific
binding was determined in the presence of 100µM mianserin.
After 30 minutes incubation at 37°C, the assay mixture was
filtered through a combination of GF-C and GF-B filters,
pre-soaked in 1% bovine serum albumin, using a Brandel cell
harvester, and were washed three times using ice cold Tris-
HCl buffer (50mM). Radioactivity retained on the filters was
determined by liquid scintillation counting. For each test
compound, the concentration that inhibited binding of
[^{3}H]mesulergine by 50% was determined using curve fitting
software (Prism). Kd values (concentration of mesulergine
required to occupy 50% of the receptor binding sites at
equlibrium)determined from saturation binding studies were
then used to calculate inhibition dissociation constants
(Ki) using the following equation:

$$Ki = \frac{IC_{50}}{1 + \left(\dfrac{Radioligand\ concentration}{Radioligand\ Kd}\right)}$$

The results are shown in table 1 below as pKi values.

Human cloned 5-HT$_{2B}$ cell-based functional assay

The following describes an *in vitro* functional assay using
human cloned 5-HT$_{2B}$ receptors to determine the ability of
compounds to block the receptor.

CHO.K1 cells expressing cloned 5-HT$_{2B}$ receptor were
maintained In Ultra-CHO medium containing 400µg/ml of G418,
100U/ml penicillin, 100µg/ml streptomycin, 2.5µg/ml
fungizone, in 95/5% O$_2$/CO$_2$ at 37°C. Ultra-CHO medium
additionally supplemented with 1% foetal bovine serum was
used when seeding the cells and removed after 5 hours.
Cells were plated in Costar 96 well white, clear-bottomed
plate at a density of 50,000 cells per well and incubated
for at least 24 hours in 95/5% O$_2$/CO$_2$ at 37°C before running
the assay.

Media was removed from the wells and 200µl of 4µM Fluo-4 AM
added, this was incubated in a Wallace Victor 2V workstation
at 37°C for 30 minutes. The Fluo-4 AM was then removed from
the wells, which were then washed twice with 200µl of buffer
(HBSS without calcium/magnesium/phenol red, 20mM HEPES, 1mM
Ca^{2+}, 1mM Mg^{2+}, 2.5mM probenecid, pH to 7.4), 180µl of buffer
or test compound was added to the well and incubated for 30
minutes. The Victor 2V injectors were used to inject 20µl
of 5-HT after obtaining 10 0.1-second baseline readings at
535nm, followed by 150 readings.

All test compounds were aliquoted in 100% DMSO at 10mM and
diluted to 1mM in 50% DMSO, subsequent dilutions were made
using buffer. Buffer was also used to dilute the 5-HT.
Data were analysed using Microsoft Excel and GraphPad Prism,
with the latter used to produce sigmoidal dose-response

curves for each compound. The compound concentration that
inhibited the 5-HT response by 50% was taken (IC_{50} - M), and
the results are shown in Table 2, as pIC_{50}, being the
negative log (to the base 10) of the measured IC_{50} values.
